

Vera | INTELLIGENCE THAT BUILDS TRUST.

When a customer disputes a transaction, how can data and technology help a bank **restore and strengthen their trust?**

With VERA, we turned that question into an engineering challenge

We are **HAGAMOS,**
The team behind VERA.

DIFFERENT PERSPECTIVES, A SHARED PURPOSE.

MARILYN BARBOSA

Marine Biologist and Data Scientist

I am a multipotential passionate about science, education and technology.

MARIO ÁLVAREZ

Automation Engineer and Web Deveoper

Interested in robotics, artificial intelligence, autonomous vehicles, and IoT.

ALEJANDRA ZABRANSKY

Data Analyst with a background in finance and international trade

Passionate about continuous learning and turning data into strategic decisions.

LUCÍA CÁRDENAS

Food Engineer and enthusiastic about the stock market

I work to fight hunger, appreciate nature's gifts — the rivers, the bees — and my guiding principle is believing in people.

HOW WE APPROACHED THE PROBLEM

Before writing any code, we asked four questions.

These questions shaped VERA around the data, the process, and the people who depend on it.

What could the data tell us?

It pointed us toward transaction disputes.

What does a dispute mean for the customer and the bank?

We considered the customer's emotions and trust, alongside the cost and time to resolve the case

How do rules differ by country?

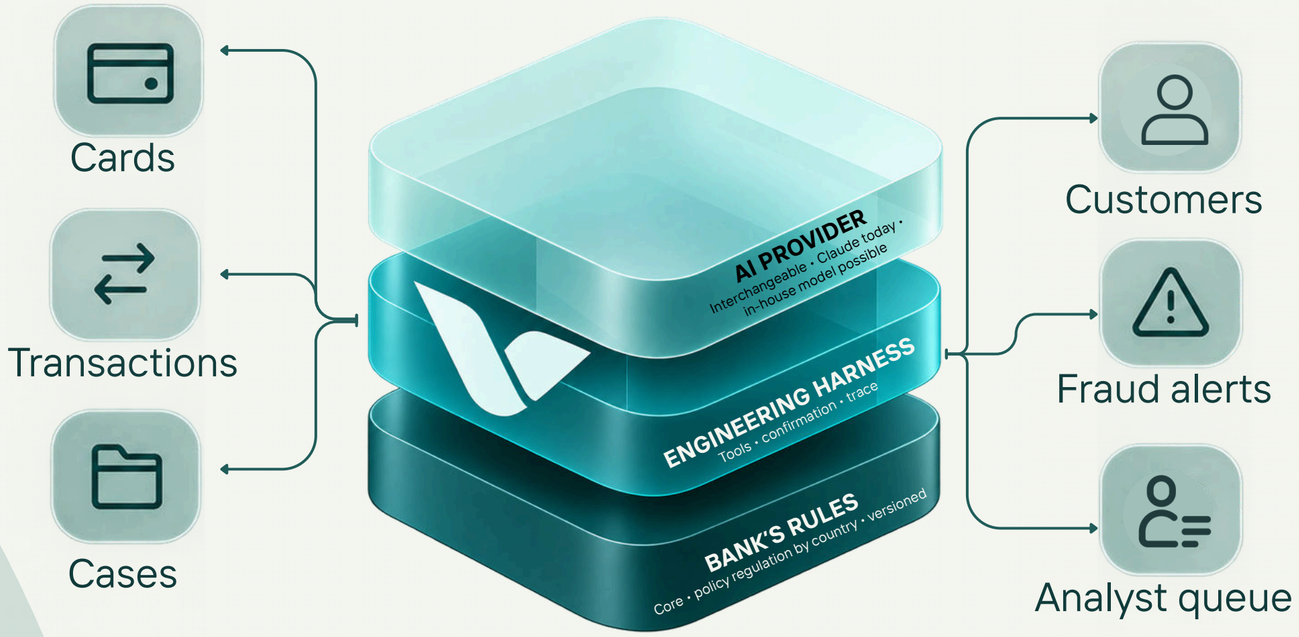

VERA needed to apply the relevant policy and make decisions traceable.

How can agentic AI work safely with existing banking systems?

VERA needed to connect to them while keeping every action under the bank's control.

Three decisions, one harness, a bank that stays in control.

1

Connect to existing systems

VERA integrates with existing bank systems. Sensitive actions require customer confirmation and are verified afterward. Automated tests protect the architecture.

2

The bank's rules decide

Versioned bank policies and country regulations guide VERA's actions. A fallback classifier ensures predictable, auditable behavior if the model fails.

3

The AI model is interchangeable

Banks can switch AI providers or run their own models in-house. VERA masks personal data before processing with Claude.

WHAT WE LEARNED

We only trust an agent we have **tried to break.**

Our biggest lesson: trust must be tested. We locked our evaluation, identified and fixed risky errors, then published both results and documented what our data could not prove. **Trust comes from transparency, showing what went wrong and how we made it better.**

A transactional dispute begins with uncertainty

With VERA, we designed a path to resolution built on data, verified evidence, clear policies and human judment.

What would it take to bring what we learned into banking operations? We look forward to exploring that question with you.
